### **DETAILED ACTION**

#### Remarks

 In response to communications filed on 18-November-2003, claims 9 and 17 are cancelled, and claims 1, 3-6, 11-14, and 18 are amended per applicant's request. Therefore, claims 1-8, 10-16, and 18 are presently pending in the application.

# Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that said subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-8, 10-16, and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over

  Anderson (U.S. Patent No. 6,003,130) in view of <u>Tehranian et al</u> (U.S. patent No. 5,878,248.)

As to claim 1, Anderson teaches an apparatus (see Abstract) comprising:

first data storage device, accessible to a motherboard (see figure 2), storing daughterboard boot-up code (see Abstract);

a coupler, coupling a daughterboard to the motherboard, defining at least a first data communication path from the motherboard to the daughterboard (see figures 2 and 4, and see column 3, lines 28-36);

Art Unit: 2175

a microprocessor positioned on the daughterboard, wherein the microprocessor includes a development port (see column3, lines 28-30, and see column 6, lines 9-26);

at least a second communication path, defined on the daughterboard, providing for communication from the coupler to the development port (see figures 2 and 4);

wherein a boot-up code can be provided from the storage device, over the first communication path, the coupler and the second communication pathway, to the development port of the microprocessor on the daughterboard (see Abstract, figures 2 and 3, and see column 4, lines 33-43.)

Anderson does not teach wherein the development port receives data from an emulator device external to the microprocessor when the development port is coupled to the emulator device.

Tehranian et al teaches a device access controller (see Abstract), in which he teaches wherein the development port receives data from an emulator device external to the microprocessor when the development port is coupled to the emulator device (see column 9, line 28 through column 10, line 27, and see column 13, line 22 through column 14, line 53.)

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Anderson</u> to include wherein the development port receives data from an emulator device external to the microprocessor when the development port is coupled to the emulator device.

It would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Anderson</u> by the teaching of <u>Tehranian et al</u>, because the development port receiving data from an emulator device external to the microprocessor

Art Unit: 2175

when the development port is coupled to the emulator device, would enable the system to optionally receive input from a virtual external storage emulator, when one is connected to the system, as taught by <u>Tehranian et al</u> (see column 13, lines 27-30.)

As to claim 2, <u>Anderson</u> teaches wherein the motherboard is configured to download at least the boot-up code, to the development port automatically, in response to a power up or a reset of the electronic device (see column 4, lines 44-67, and see column 6, lines 14-26.)

As to claims 3, 6 and 14, <u>Anderson</u> teaches wherein the daughterboard includes a DRAM (see figure 2) and a memory controller (see figure 2) and wherein the boot-up code comprises configuration information for configuring the memory controller (see column 2, line 59 through column 3, line 22, and see column 5, lines 50-67.)

As to claim 4, <u>Anderson</u> teaches a method for performing boot-up in an electronic device (see column 5, lines 13-17) comprising a motherboard and a coupled daughterboard (see figure 2), the daughterboard comprising a microprocessor, the microprocessor comprising a development port (see figure 2), the method comprising:

automatically downloading at least first boot-up code from the motherboard to the development port, in response to a power-on or reset of the electronic device (see column 4, lines 44-67, and see column 6, lines 14-26); and

using the boot-up code, in the microprocessor of the daughterboard, for performing at least a first boot-up operation (see column 5, lines 13-17.)

Art Unit: 2175

Anderson does not teach wherein the development port receives data from an emulator device external to the microprocessor when the development port is coupled to the emulator device.

Tehranian et al teaches a device access controller (see Abstract), in which he teaches wherein the development port receives data from an emulator device external to the microprocessor when the development port is coupled to the emulator device (see column 9, line 28 through column 10, line 27, and see column 13, line 22 through column 14, line 53.)

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Anderson</u> to include wherein the development port receives data from an emulator device external to the microprocessor when the development port is coupled to the emulator device.

It would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Anderson</u> by the teaching of <u>Tehranian et al</u>, because the development port receiving data from an emulator device external to the microprocessor when the development port is coupled to the emulator device, would enable the system to optionally receive input from a virtual external storage emulator, when one is connected to the system, as taught by <u>Tehranian et al</u> (see column 13, lines 27-30.)

As to claims 5 and 12, <u>Anderson</u> teaches wherein the boot-up operation comprises configuring a port, different from the development port (see column 5, lines 60-63.)

Application/Control Number: 09/499,598 Page 6

Art Unit: 2175

As to claims 7 and 15, <u>Anderson</u> teaches the method further comprising downloading at least a portion of an operating system for the microprocessor, from the motherboard, using the development port (see column 1, lines 56-67.)

As to claims 8 and 16, <u>Anderson</u> teaches wherein the step of downloading the at least first boot-up code is performed while the daughterboard is coupled to the motherboard (see column 3, lines 23-41.)

As to claims 10 and 18, <u>Anderson</u> teaches wherein the first boot-up operation is performed in the absence of storing the boot-up code on a daughterboard non-volatile memory prior to the power-up or reset (see column 3, lines 2-22.)

As to claim 11, the applicant is kindly directed to discussions and remarks made in claims 1 and 4 above.

As to claim 13, <u>Anderson</u> teaches wherein the means for performing the first boot-up operation comprising means for initializing DRAM chip selects (see column 4, lines 1-3, and see lines 33-43.)

## Response to Arguments

4. Applicant's arguments filed on 18-November-2003 with respect to the rejected claims in view of the cited references have been fully considered but they are moot in view of the new grounds for rejection.

Art Unit: 2175

#### Conclusion

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a).

Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

6. Any inquiries concerning this communication or earlier communications from the examiner should be directed to Tony Mahmoudi whose telephone number is (703) 305-4887. The examiner can normally be reached on Mondays-Fridays from 08:00 am to 04:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Dov Popovici, can be reached at (703) 305-3830.
